

IN THE SPECIFICATION

At page 2, line 12, please replace with the following paragraph:

The various kinds of materials concentrated on triphenylamine derivatives used usually have been known widely as the materials used for such organic EL element. However, only very small number of materials are suitable for the practical use. N,N'-diphenyl-N,N'di(3-methylphenyl)-4,4'-diaminophenyl(TPD), for instance, has been informed (Applied Physics Letter, Vol. 57, No. 6, 531, 1990). However, this compound is thermally unstable and has a problem in respect to the life of element produced. Though lots of triphenylamine derivatives have been known (United States Patent Nos. 5047686, 4047948 and 4536457, Japanese Patent Publication Document No. 06-32307 and Japanese Laid Open Patent Application Nos. 05-234681, 5-239455, 8-87122 and 8-259940), the most of them are not satisfactory at the aspect of the feature.
